

The standard model in a stylish design
equipped with advanced functions

EC-2700

Unique Function

Making a diverse and sophisticated
air-massage possible

エアマジック Air Magic

The high-capacity, high-output
compressor effortlessly controls
35 air bags to provide Fujiiryoki's
unique and innovative massage.
The whole body is soothingly
massaged by complex actions
such as stretch and twist.

Combination of
mechanism and air **677** types of massage

The combination of Fujiiryoki's Super-Mechanism with two massage balls and air massage makes it possible to provide 677 types of fine massages from the nape to the soles.

Unique Function

KIWAMIMECHA Massage

Neck massage

The massage balls
improve blood circulation
around the neck by
gripping and stretching
the nape.

Super Knead / Super Tapping

The tightness in the
trapezius is relieved
by providing deep
stimulation to the upper
part of the shoulders.

Super Back Knead / Super Back Tapping / Buttocks Massage

These functions are
effective in soothing
the soreness caused
by the strain in the back
or buttocks, neuralgia
and muscle ache.

Firm grip and slow stretch

Stretch Massage

The calves are massaged by the air bags in the ottoman by gripping and slowly stretching them. This massage improves the circulation of the blood in the lower body, which is prone to swelling.

● Stretch

The legs are held firmly and stretched forward.

● Leg Stretch

The legs are held firmly and stretched downward.

● Double Leg Stretch

The legs are held firmly, stretched forward and then downward.

The lower back is sterically stretched by the cross & twist action

Twist Massage

The air bags located in the area of the chair for the lower back and buttocks independently move from side to side, up and down to provide a 3D massage. It loosens tense muscles in the lower back and buttocks.

● Air Cross

Air to the lower back and buttocks is circulated diagonally to provide a firm stretching action.

● Air Twist

Air to the lower back and buttocks on one side of the body is circulated simultaneously to provide a gentle stretching action.

Hand & Arm Massage

There is a concentration of pressure points in the hands and arms. Tension in these points is properly released by two types of massage: Grip and Knead.

Buttocks Air Massage

Soft air stimulation gently loosens the muscles in the buttocks and the back of the thighs to promote a better blood circulation in the groins.

Lower Back & Buttocks Massage

The interlocking action of intensive massage to the lower back and air massage to the buttocks makes it possible to provide relief to the lowermost part of the sidebone, which cannot be reached by ordinary massage.

Leg Massage

The air bags aid the "milking action", which promotes the circulation of blood in the lower body, by repeating compression and release from the lower part of the calves to the upper part of the calves, much like milking a cow.

Sole Massage

The soles are stimulated by air bags imbedded with pressure balls as the feet are firmly held from the heels.
